Features Actions and commands In AutoCAD, actions are commands that can be defined in order to perform a task. When performed, actions typically produce a visual output. Actions are used in construction industry workflows. Some actions are: Create Family – Creates a new family in the drawing that can be used to create objects. Actions have attributes and parameters that control their operation. Parameters can be defined in the Drawing Properties, and can be changed on the fly. Attribute values, for example the cost of a plot, can be defined in the attributes table and also can be changed on the fly. Contents – Allows the user to examine the various contents of a drawing, including layers, layers properties, linetypes, drawing objects and properties and so on. What's New In AutoCAD?

A small drawback: The results sometimes aren't as good as what you can do with AutoCAD directly, so it doesn't completely replace the need to do some editing on paper. Meshes, Shapes, and Locators: Add a new geometric shape with 2D tools. (video: 1:28 min.) 3D shapes now have most of the tools that existing 3D objects have. Added support for Boolean operations on meshes, shapeless objects, and locators. Colored annotation tools: Use colored annotation tools with or without transparency. Rotate, Scale, Trim, Annotate, and Align: Scale a drawing, rotate, align, trim, and annotate it with direct proportion or percentage adjustments. Added auto-sizing and auto-centering to the align and trim tools. Geometric constrains: Constrain drawing actions based on the location of the tool, the current and previous drawing element, or another drawing element. Vector Polygons: Add polygons that can be edited freely and used as a graphic or extruded. Drawing on a Wireframe: One of the biggest changes in AutoCAD is the new wireframe feature. The wireframe feature is useful in a lot of situations, such as when you want to make an idea of how a final product would look like, or when you want to show an image of a 2D object in the context of a 3D model. The wireframe feature is particularly useful in a situation where a tool is set to a relative scale. The wireframe feature works with all the drawings except for some layered drawings. You can create wireframe with either "wire" or "wireframe" as the object. You can select whether to use wire in white and wire in black, wire in black and wire in red, or wire in gray and wire in black. Add custom labels and text properties to the wireframe objects. Use a scale factor that is independent of the tool's current scale setting. The scale factor can range from 1 to 400. Use a proportional axis for scaling. Set the direction to "relative to the edge" to keep the rotation of the wires consistent with the surrounding geometry.
