In such vacuum conveyors, a gas in the chamber is evacuated from the chamber, such as by connection to a vacuum pump. Thus, the rotor is provided in the chamber so that a gas and particulate matter conveyed within the chamber are drawn from the chamber by the rotor as the rotor rotates within the chamber. The rotor may also include a plurality of radially extending vanes which define a shroud for conveying the gas and particulate matter drawn from the chamber. Examples of such conveyors are disclosed in U.S. Pat. Nos. 3,053,399; 3,747,837; 3,974,877; 4,466,524; 5,605,126 and 6,186,909, the disclosure of each of which is incorporated herein by reference. While such rotary vacuum conveyors are known in the prior art, a need remains for a rotary vacuum conveyor having a rotor configured to substantially seal the chamber from the environment during operation of the vacuum conveyor, while still providing an efficient transfer of particulate matter and gas from the chamber to a chamber discharge and while providing adequate clearance for the rotor. This study is part of a National Institutes of Health-sponsored study to develop an epidemiologic model of the impact of breast cancer screening on mortality. The focus is on developing a Bayesian model to predict mortality from a cohort of women with breast cancer detected by screening and a cohort of women detected by symptomatic presentation. We are using Bayesian models for survival and disease-free survival to describe a state space model of disease progression and survival. This model takes into account the time from diagnosis to death and time from diagnosis to recurrence or second cancer. Since much of the impact of breast cancer screening comes from detecting cancers that would not have been diagnosed at the time of presentation, a focus on mortality is justified. The use of Bayesian methodology enables us to analyze interval-censored data. This is the first model to use Bayesian methods to analyze interval-censored data. The data will be collected from the National Surgical Adjuvant Breast Project (NSABP) and the Nurses' Health Study (NHS).
