# Roomcap Antenna Pdf PATCHED

the ideal position for the antenna is next to a window on the side of a house that is closest to the transmitting station. this will allow you to receive the transmission of all stations in your area. if you move the antenna to a window in an attic, or basement, you will not be able to receive the stations that are in the attic or basement. if you move the antenna to the side of a building, you may be able to receive all stations within 100 miles. if you move the antenna to the side of a mountain, you may be able to receive stations from across the continent. the antenna should be placed in the most direct line to the transmitting station. the ideal height of the antenna is about 2-3 meters above the window or, if this is not possible, then the optimum height is about 1 meter above the window. the height of the antenna does not affect the quality of the signal. if the height of the antenna is reduced, the range of the antenna will be reduced. the ideal direction of the antenna is from the window. if you point the antenna in any other direction, you will receive a weaker signal and you will have to point the antenna closer to the transmitting station. the angle of the antenna is not important. if the antenna is not pointing in the right direction, you will receive a weaker signal and you will have to point the antenna closer to the transmitting station. if you point the antenna in the wrong direction, you will receive a weaker signal and you will have to point the antenna closer to the transmitting station. if the antenna is pointed in the wrong direction, you will have to move the antenna closer to the transmitting station.

## Roomcap Antenna Pdf

the antenna that he had was 50w pa but his claims that he could transmit 40w on 80m was nonsense. he also did not know what he was doing. he had a power of 50w pa which will put out only 1 to 1.5 db of signal from your transmit power. so if you need 40w and your antenna puts out only 10 watts, you will need to raise the power 20 db more. that is not a big deal for an antenna that is 50w pa, but it would be impossible with his suggested antenna. his "power efficient" antenna was stupid because you can never make a lossless antenna, so he lost more gain than he gained. he needed a proper 50w pa amplifier with a matching cable and a power feed-back loop to make the antenna work properly. his antenna was of no use. the distance he claimed he transmitted on was 80m but that was not over the air but it was over the cable, not tv.

had he been on the air he would have been paid for that signal. you can not transmit on 80m if you are on your tv. antennas that transmit on television or fm don't transmit on 80m because there is no 80m to transmit on.-- i received a copy of his book. it is sold at the top end of the price range of \$25-30. he is trying to get a return on his investment by taking advantage of the current economic conditions. i was actually quite pleased with the book. i think that there are some good ideas in it. it has an introduction that outlines the theory of the book, which describes the background of the author, and it has some basic references for the interested reader. there are some practical tips and good illustrations, which i thought were very helpful. however, the problem is that the author states that he has 300,000 subscribers to his book. i would be willing to bet that 100,000 of those are not really readers of his books, but that is not relevant to the book. that is the nature of the internet and the reality of the internet's impact on publishing is a relatively recent phenomenon. unfortunately, the author may have been counting "subscribers" and "distributors" of his book as part of his numbering of subscribers. it is most likely that he did this himself and there is no one else to ask. he should have been more forthcoming with the distribution numbers as they would have been very helpful to a judge of his credibility. the author does have some good advice for beginners and amateurs on using antennas and other ham radio equipment. he does not have a deep understanding of rf. he will tell you to buy a power amplifier, figure that you will need this amplifier and then figure that you can send 100 watts or a thousand watts for 50 watts of amplifier. that is a common trap for beginning ham operators and anyone who does not read about power levels on antennas and the additional losses that come with 100 watts of amplifier. he does know how to build an antenna, however, he suggests that a 50 or 60 meter omni-directional is best because of the lack of power that is being generated. the author tries to sell an antenna and amplifier for \$25. the problem is that they say that you can transmit with a distance of up to 5 miles (180 miles if you include the ground loss). a user has to find out that this is not true. i believe that the author should disclose that the book is a fraud. 5ec8ef588b
