The new release also records events in a new category of popups called Events. For example, it records when you open a new catalog and how long it took to do so. A more interesting and useful use of Events is when you are grappling with organizing images. It records the last time it changed the image, for example by opening the image's layers palette or setting or changing layer's opacity. Again, I have to click save to get past this screen. Without saving, this information becomes useless because it is reported the next time you change the image. It's echoed in the question it asks when you save the catalog, for example, "What should the last change date of the catalog file be?" Better question would be "Is the last change date of the catalog file the same as the last art change (such as when one changes a layer's opacity)?" If I overlooked a tool that makes this possible, please tell me. I'd like to know ASAP. In any case, something that shouldn't need saving is saved. Behavior is improved as well thanks to the new"Advanced" Preferences panel. It's great that this panel can be expanded and collapsed at will, and that it keeps its place when the *PC Magazine* team installs new software. The panel can get out of hand if you add too many tabs. In addition, there is only one slider to set the image size. You can also take a snapshot of a gripe such as an issue with the license email confirmation. You can add comments on the snapshot or email text, which appears below it. When setting up the snapshot, you can set any resolution and only save or check the file once. Anyone can comment on it before you save. Snapshots save to a new folder. You can't affect the file when saving the snapshot.
