Adobe Photoshop isn't restricted to the *Windows* platform, and I've used Photoshop in Mac OS X for many years. In my opinion, at least, Photoshop is a program that's wonderful for pro, advanced, and very advanced amateur photography. I've switched to Lightroom CANDO, where ambient snaps are made first, and one cohesive 'Lightroom style' image is created for a less complex editing process, which can be immediate processing, as well as a finishing step if there are specific edits needed. You can learn all the things that Lightroom can do, and a third-party script can easily plug-in to a less sensitive screening ETL process, shallow and large brush or magic wand, etc. The reason I'm using Elements 11 on Mac OS X today is, I use an Ethernet cable, but I still have a USB connection to the Mac. I also use programs like Aperture, Final Cut Pro, Premiere Pro, and other programs on the same Mac, and they connect automagically. I have an Ethernet over Ethernet device that plugs into my MacBook Pro, and my Mac begins to automatically search for that device when I plug it in. After attaching the adapter, I can ping and XNS discover a list of Bluetooth devices in range, and I can manually initiate a 'pairing' for my similarly Bluetooth 4.0 device, and then I'm just setting up for networking. I never have to initiate either process. If the file's already being exported to a display device or server, the 4 GB file is only shown as being the same size for a few seconds without any image, but it has only changed slightly from the original.

It can also be used to apply patterns to your images. The Gradient tool within the Fill tool lets you create a nice, faded background effect of the color of your choice. First, select the layer you want to apply your blending options and effects to. Then, open up your blending options and choose the one you'd like to apply.
