The viewer window also has new features, such as a capability to choose a different workspace based on how you are working. For example, if you are editing a large, complex image, you can choose to jump to a smaller workspace for simpler edits, and vice versa. To give you the best performance with two monitors, Photoshop also gives you the ability to have two different, separate workspaces on each monitor. You can then close out the window, even if you change windows in it, without affecting its size or your other workspaces. Windows can be configured into “floating” groups, so you can dock them to the sides of the screen. Colors now print more intelligently, recognizing color and range limitations that you hold and adjusting images accordingly. In addition, Adobe now understands the limitations of the most popular printer drivers that are used in an offline mode. This allows Photoshop et al. to perform relatively better even if your printer has a known problem, especially the Ghosting effect. (This is how printer ink and toner are deposited on paper in an offset printing process.) ACR 7.0 is now a 64-bit application, which significantly improves its performance. The major addition here, and of course, the most interesting one, is the Stroke feature that now exists via a new panel in the Brush Options. Stroke is a way to overlay a guide over an image and define its thickness and color. Stroke is especially useful for redrawing a path or line in another layer, so you don't have to redraw it. I'll discuss how to use the Stroke panel in detail below.
